Supplementary Figure 1: Representative image of a section from a CTL rat at L8 stained with anti-insulin antibody as described in the methods section. Image was captured under a final magnification of 5X. Horizontal bars = 100 µm. The arrows indicate all insulin positive cell agglomerations that were classified as extra-islet insulin positive cell clusters (EICs) (<300 µm²) (A) or small (300-1999 µm²) (B), medium (2000-9999 µm²) (C), large (10000-49999 µm²) (D) or very large (>50000 µm²) (E) islets.
